

Dreamweaver Chapter 2 – Building a Website

1. The _____ is used to define a website.

2. Complete the table below using the following: Editing Files , Testing Files , and Sharing Files.

a.	Specify the testing server location and other settings if a server technology is used.
b.	Specify the site name, URL of the site, and the server technology to be used. You can choose to edit the files locally and upload them to a server, or edit them directly on the server. In either case, you need to specify the location of the files.
c.	Specify the connection method to the remote server and its settings.

3. The _____ tab in the _____ wizard allows you to modify the site definition information. This tab allows you to modify the local, remote and testing server settings, and other site settings in addition to the options available on the Basic tab.

4. The _____ Sites dialog box enables you to manage the sites that are defined in Dreamweaver. It allows you to edit site definition information such as the site name, location of the local root folder and the default images folder, and other site settings. It also allows you to create a new site, duplicate or delete an existing site, and import or export a site's settings.

5. The _____ panel displays a list of files necessary for the website. These files include graphics, HTML files, and other objects. It allows you to access the defined sites as well as other files on your local system. It also allows you to manage most aspects of the website, such as viewing, organizing files and links, and uploading files to a web server. Organizing the files within Dreamweaver helps you to maintain the structure of the site and the links.

6. When a site is defined in Dreamweaver, folder and file operations such as creating new folders, and moving, removing, and renaming files and folders must be done using the _____ panel. This allows Dreamweaver to keep track of the location of files and update any links or references to the files when they are moved or renamed. If file and folder operations are performed outside Dreamweaver, links and references will not be updated, resulting in errors when the web pages are viewed.

7. To define a basic HTML website:

- a. Choose _____
- b. In the _____ wizard, select the _____ tab.
- c. In the _____ text box, type the desired name and click _____.
- d. If necessary, select _____
- e. Click _____
- f. If necessary, select _____
- g. To the right of the _____ text box, click the folder icon.
- h. In the _____ dialog box, navigate to the desired local root folder, which contains the files required to build the website, and click _____.
- i. From the _____ down list, select and _____ click _____.
- j. Click _____ to define the site

8. To edit the site definition information:

- a. Choose _____ Sites.
- b. In the _____ dialog box, select the desired website and click _____.
- c. In the _____ wizard, select the _____ tab.
- d. If necessary, in the Category list box, select _____.
- e. In the Local Info section, modify the desired information.
 - In the _____ text box, edit the site name.
 - In the _____ text box, specify the location of the local root folder.
 - In the _____ text box, specify the location of the folder, which contains the images required for the site.
- f. Click _____ to modify the site definition.
- g. In the _____ message box, click _____ to recreate the cache for the site.
- h. In the _____ dialog box, click _____ to apply the changes.

9. While naming files, it is better to use _____ characters without any _____, _____, and _____ between the names. This is because some web servers, such as UNIX and LINUX, are case sensitive and do not support special characters and punctuation. When you need to separate the words in a file name, use an _____ or a _____.

10. _____ refers to the number of individual pixels that a predetermined area or space on a page can contain.
11. The standard resolution for web pages is _____ pixels.
12. A page size of 800 x 600 denotes that _____ pixels are displayed horizontally and _____ pixels are displayed vertically.
13. The higher the resolution, the _____ the screen elements will appear.
14. When a web page with low resolution is viewed on a screen with higher resolution, the screen will display _____ in the remaining area.
15. The _____ dialog box contains categories based on which you can create different types of documents
16. Complete the table below with Blank Page , Blank Template , Page From Template , Page From Sample , Other

	Web pages based on existing templates.
	Web pages based on sample pages that contain predefined elements, such as CSS style sheets, framesets, and themes.
	Blank web pages of various types, such as HTML, JavaScript, and ColdFusion. It also allows you to select predefined CSS layouts for the pages.
	Templates of various types with predefined CSS layouts.

17. The _____ defines the tags and structure of the web page being created. Dreamweaver allows you to create web pages using various document types, such as HTML 4.01 Transitional, HTML 4.01 Strict, XHTML 1.0 Transitional, XHTML 1.0 Strict, XHTML 1.1, and XHTML Mobile 1.0. By default, Dreamweaver creates web pages using the XHTML 1.0 Transitional document type.
18. The _____ is the entry point of a website, providing access to other pages on the site.
19. By default, the home page is named _____ so that the web server identifies it as the entry point of the site when it is accessed using the URL of the site. If the home page of the website is referred to by any other name, such as home.html, then it can be accessed only by typing the URL of the site followed by "home.html." This will force visitors to remember the home page names of every site they visit.
20. _____ are tags that appear within the _____ tag, which includes <meta> tags and other elements that set the properties of a page.

21. A few examples of elements that are defined in the head section of a page are page _____, _____, and _____.
22. _____ are HTML tags in the head section that describe a web page.
23. A <meta> tag can include information, such as _____, _____, and _____ . This information is invisible to viewers while they are browsing, but can be used by web server software applications to pick up the page and display it in the search results.
24. To create a web page:
- a. Choose _____
 - b. In the _____ dialog box, specify the desired page type and layout.
 - c. Click _____ to create the web page.
 - d. In the document window, add the desired content.
 - e. If necessary, copy the content from the desired source and paste it in Dreamweaver.
 - f. On the _____ toolbar, in the _____ text box, type a title for the page.
 - g. If necessary, insert the head elements.
 - a. Display the dialog box for the desired head element.
 - i. Choose _____ and then from the submenu, choose the desired command to insert a head element.
 - ii. Or, in the _____ panel, click _____ and select the desired option.
 - b. In the dialog box displayed for the head element, specify the desired information and click _____
 - h. Choose _____
 - i. In the _____ dialog box, navigate to the desired folder.
 - j. In the _____ text box, click and type the desired file name.
 - k. Click _____ to save the web page.
