Dreamweaver Project 1

Create a folder in your my documents folder and name it yourname_dolphin (example: frankel_dolphin)

Save the pictures from my website to this folder.

Create a basic web page using the following information and save it in the same folder

Your page needs to include the following:

- Text (*paragraphs and bullet lists*)
- An image with alternative text (*Alt text*)
- An e-mail link

Save file as: [lastname_sample.html](#)

Email to: msfrankel@comcast.net

Subject: DW Project 1

Her Story

At three months of age, Winter (*an Atlantic bottlenose dolphin*) was wrapped tightly in a crab trap line and was unable to escape. She was rescued from Mosquito Lagoon (*near Cape Canaveral*) and transported to Clearwater Marine Aquarium to begin a long rehabilitation. Unfortunately, Winter lost her entire tail as well as two vertebrae as a result of the serious injuries that she had sustained.

Despite the odds against survival, Winter's energy and ability to adapt to her new physical form has surpassed the expectations of many experts. Winter has done amazingly well in the short time since her stranding. She has completely healed, adapted to a new swim pattern, and learned to eat fish on her own...about twelve pounds a day! She is growing quickly, and now weighs in at 250 pounds!

Thanks to Hanger Prosthetics & Orthotics, Winter now wears a prosthetic (artificial) tail. Her current tail took a long time to develop, including several different models along the way. She will likely need updated tails throughout her entire life.

It took long to develop her tail because:

- No dolphin has ever needed such an extensive prosthetic before
- Dolphins skin is sensitive and a protective sleeve had to be developed first
- She had learned how to swim sideways without a tail and had to be trained to move up and down with the prosthetic tail.
- She is still growing so she will need new tails until she has reached full maturity
